

Giant Salamander (*Andrias japonicus*) Skeleton Model

With a unique flat, semi-circular head, and short ribs and vertebrae, the ribs and shoulder bones have not fully developed.

Even with a larger body, they use the power of the river to float, so their legs are short and their shoulders and ribs are quite weak.

This skeleton is actually Ryu-chan, who was raised in the center but sadly died in 2010. There is a possibility that he was a Chinese Giant Salamander.
